ABSTRACT. Smith-Magenis syndrome (SMS) is a rare syndrome with multiple congenital malformations, including development and mental retardation, behavioral problems and a distinct facial appearance. SMS is caused by haploinsufficiency of RAI1 (deletion or mutation of RAI1). We describe an eight-year-old female Chinese patient with multiple malformations, congenital heart defect, mental retardation, and behavioral problems (self hugging, sleeping disturbance). High-resolution genome wide single nucleotide polymorphism array revealed a 3.7-Mb deletion in chromosome region 17p11.2. This chromosome region contains RAI1, a critical gene involved in SMS. To
the best of our knowledge, this is the first report of an SMS patient in mainland China.

**Key words:** Smith-Magenis syndrome; Congenital heart defect; High-resolution single nucleotide polymorphism; Sleeping disturbance; Mental retardation
